The continuing critical role of Gas in the Energy Mix

APPEA conference May 2022

Disclaimer

RISC is an independent advisory firm, providing insightful and impartial advice to a broad range of clients in the energy industries. We provide a more comprehensive, reliable and respected opinion faster than anyone else in the industry, enabling our clients to make their business decisions with confidence.

The statements and opinions attributable to the author and/or RISC in this presentation are given in good faith and in the belief that such statements are neither false nor misleading.

In preparing this presentation the author has considered and relied solely upon information in the public domain. This information has been considered in the light of RISC's knowledge and experience of the energy industries and, in some instances, our perspectives differ from some of our highly valued clients.

In some cases the views and opinions of the author may differ from those held by others within RISC.

RISC has no pecuniary interest or professional fees receivable for the preparation of this presentation, or any other interest that could reasonably be regarded as affecting our ability to give an unbiased view.

RISC: Getting the Energy Mix Right (2016/17)

Emissions Comparison for Power Generation Mix

Globally emissions reductions have been driven by a switch from coal-fired power generation to gas-fired

Emissions reductions have been driven by a switch from coal-fired power generation to gas-fired

Increased gas use has helped the USA reduce emissions

- Emissions decline in US has been driven by Market forces – not policy
- Coal plants have been shut in favour of cheap gas (Shale gas (fracc'd) and renewables)
- New policies will likely drive further reductions

U.S. NET GREENHOUSE GAS EMISSIONS RELATIVE TO INTERNATIONAL COMMITMENTS
In millions of metric tons CO₂e, excludes international bunker fuel use, 2005-2019

InsideClimate News

Emissions reductions have been driven by a replacement of coal-fired power generation to renewables support by gas-fired generation

In the UK increases in renewables and decreases in emissions have been supported by gas use

In the UK:

- Emissions from power generation have fallen by approximately 65% since 2010.
- Coal use in power generation has fallen from around 40% in 2010 to less than 2%.
- UK went for 2 months “coal free” in 2020.
- Gas use remained relatively unchanged and its share of the generation market increased to around 35-40%
- UK emissions are now the lowest in over 130 years (since the 1880’s)

2021:

- 3% Growth in renewables capacity of ~1000MW did not lead to a growth in renewables generation
- Less sun and wind resulted in a 17% decrease in renewables generation
- Gas use increased in 2021 (+19%)

Australia has not switched from coal...yet

Australian emissions have not reduced as much due to our continuing reliance on coal

South Australia's renewables success also depends on gas

SA experience shows that batteries do not provide an alternative generation supply

- Hydro and pumped hydro – good in Norway, New Zealand & Tasmania, and Snowy 2 will make a large impact (2GW / 350GWh)
- Nuclear – accepted in many OECD countries but not in Australia
- Batteries
 - SA: 120MW / 190 MWh.
 - NSW: 500 MW / 2GWh (Liddell 2GW)), 700 MW / 1.4 GWh (Eraring 2.9GW)
 - WA: 100 MW / 200 GWh.

PVNSG = 100kW-30MW “non-scheduled generation”)

The Hydrogen economy is still a long way away

By 2040 Australia “might be producing” ~5 Mtpa of H₂ (energy equivalent of ~12 Mtpa of LNG)

- Current storage options don't have the long-term capacity required
- Green Hydrogen is a long way-off
- UK Aspirations:
 - 1 GW of low Carbon H₂ by 2025 (130 ktpa)
 - 5 GW of low Carbon H₂ by 2030 (650 ktpa)
- Current largest electrolyzers in the world:
 - 30 MW (China)
 - 20MW (4x5MW in Canada, & China)
- Planned
 - 24 MW (Germany - end 2022),
 - 40 MW (France – end 2024 *pending approval*)
- 650 ktpa is roughly equivalent to 1.5Mtpa of LNG,
- the UK currently imports 10-15 MTPA of LNG, and that is growing.
- 5 Mtpa requires ~40GW of electrolyzers
